

Problem2

Yufei Yin

Question 2a, (3 points):

Build a query that selects the city names, states and zipcodes from the 'zip' for the state of Illinois.

(Hint: Print the column names and then try to identify the exact column names before building the SQL query. You may need to figure out the 2 letter state code.)

How many records are returned by this query?

```
names(dbReadTable(dbcon, "zip"))
```

```
## [1] "zip_code" "latitude" "longitude" "city" "state" "county"
```

```
sql_qry = "SELECT zip_code, city, state FROM zip WHERE state == 'IL'"
```

```
dim(dbGetQuery(dbcon, sql_qry))[1]
```

```
## [1] 1596
```
